

This project is focused on the experiences of church youth leaders and event organizers who have recurring uncertainty regarding event attendance. The two primary personas are Marcus Alvarez, a youth leader, and Angela Kim, a church event organizer. They both operate within an environment where communication is stretched across multiple informal and formal systems and tactics. Expectations are uncertainly constructed and attendance directly affects morale, community participation, and event decisions.

Both personas are responsible for creating meaningful gatherings, but neither has strong certainty with how event information is received and acknowledged. Their experiences fluctuate over time and are shaped by context.

When Marcus plans a youth event after a full workday, he is operating under time pressure and low energy. His communication methods are primarily text message based and verbal announcements. In one scenario, he feels optimistic when planning, while in another, he feels a decrease in confidence due to a low turnout from the previous event. His emotional state is shifted towards self-doubt. The system has not changed but the scenario has. This shows how experience is situational rather than based on statistics.

In Angela's experience, it is shaped by good structure and organization. She focuses on the church bulletin and service announcements. In addition, she focuses on planning in advance but still receives questions from church goers. This shows that attendance uncertainty is not a scheduling or planning issue but rather a communicative issue. Her experience includes physical preparations but also background constraints. These elements shape her experience even though church goers may never see them.

This problem space is meaningful because community participation is essential to church structure. Low attendance discourages volunteers and organizes and limits opportunities for the church to grow as a community. By modeling experience over time and through different scenarios, we focus on the core challenge is not the will of participating but the expectation. Understanding how uncertainty forms structurally and internally, it provides a research foundation for identifying the needs, future decisions, and eventually a resolution.
